#### Introduction

STE test is an *in vitro* eye irritation test using cell viability as an end point in SIRC cells following just a 5 minute treatment, and the good correspondence has been confirmed between the STE irritation categories (non irritant [NI] and irritant [I]) and GHS categories (NC and category 1 [Cat. 1]/category 2 [Cat. 2]). Generally, cytotoxicity tests using cultured cells have an advantage of being simple, a quick procedure, and a low evaluation cost. The STE test has the advantages not only easy-to-use but also evaluable the eye irritation potential of water insoluble substances by using mineral oil as test vehicle. The STE test is planned for peer review in 2013 and may be accepted as an OECD test guideline for classifying ocular irritation. In this study, the technical transferability and inter-laboratory reproducibility of the STE test were evaluated in 3 contract research laboratories as a naive laboratory.

# **Study design**

#### Step 1: Transferability

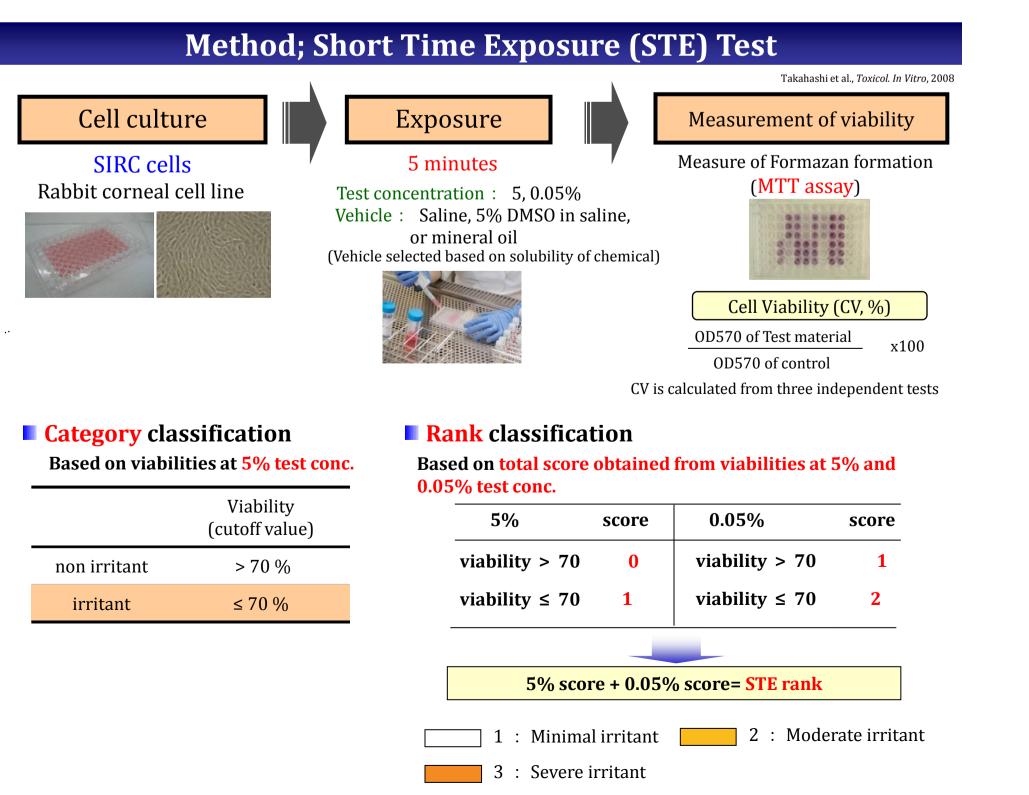

Five representative chemicals, which have a lot of background data in Kao Corporation, were tested in three naive laboratories at first. Three of five chemicals were water-soluble chemicals (Sodium laury) sulfate, Calcium thioglycolate, and Tween 80). Two of five chemicals were water-insoluble chemicals (1-Octanol, and Dodecane). Concordance of STE rank between each laboratory was evaluated.

#### Step 2: Inter-laboratory reproducibility

Twenty cosmetic products (Shampoos, Conditioners, Hair coloring products, Skin cleansers, Hair stylers, Deodorants, and Moisturizers) were tested in each laboratory. Concordance of STE category (irritant or non irritant) and STE rank between each laboratory was evaluated.

#### Laboratories

- 1. Institute for In Vitro Sciences, Inc. (US): IIVS
- 2. Harlan Cytotest Cell Research, GmbH. (Germany): Harlan
- 3. Food and Drug Safety Center (Japan): FDSC
- 4. Kao Corporation (Japan): Kao \*lead laboratory

# Step 1: Transferability

#### Results

Cell viability (%) at 5% concentration

#### There is only small variation in some test samples. Code A, D, G, J, K, and R were distributed astride 2 ranks.

# **Sponsor: J. Avalos**<sup>6</sup>

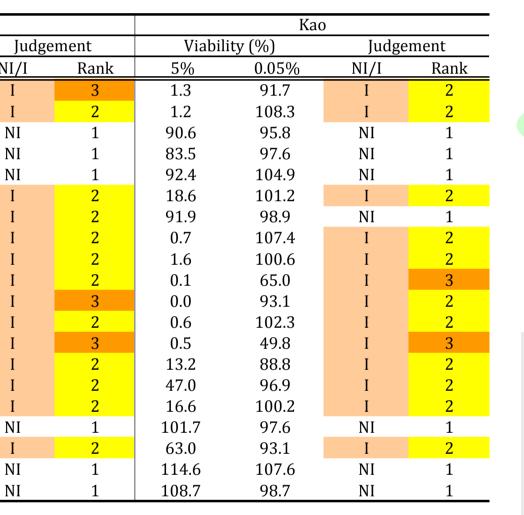

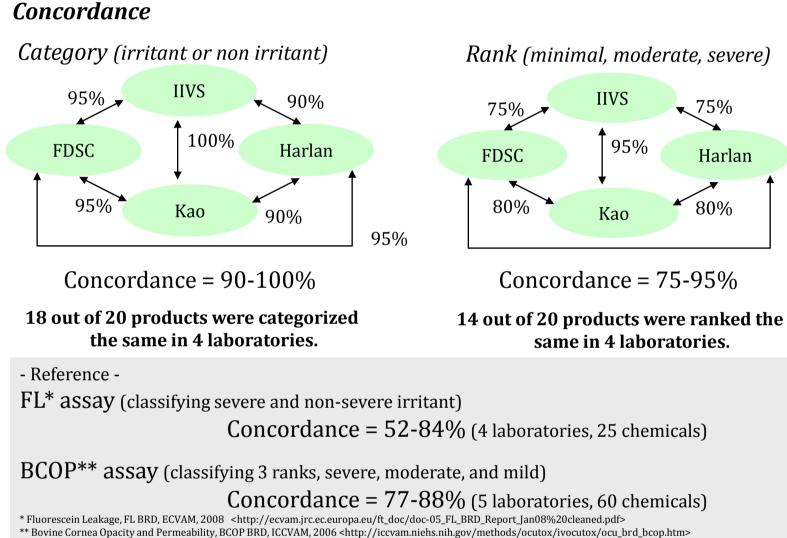

STE ranks of 5 chemicals in four laboratories were identical

# Transferability was successfully confirmed.

# Transferability was successfully confirmed as well as FL assay and BCOP assay.

# Technical alignment

etails of unmatched materials						
Solvent	Sali	ine	Mineral oil			
Soluble state	Dissolution	Uniform	Dissolution	Uniform		
Soluble state	Dissolution	dispersion	Dissolution	dispersion		
<pre># of test materials</pre>	12	6	0	2		
# of unmatched materials	3	2	-	1		
Code	A, J, K	D, G	-	R		

#### Sample preparation (Solubility)

Diluents of Code D, G, and R were clouded (uniform dispersion).  $\rightarrow$  The soluble states of each material might be different between laboratories, and may cause difference in viability.

#### Exposure of mineral oil

In case of Code R. mineral oil was used as solvent. Mineral oil sometimes induce cell ablation.

 $\rightarrow$  It might effect the cell viability depending on the skill.

# Better concordance may be obtained with technical improvement in sample preparation, exposure, and washing.

# Conclusion

# Transferability

Identical results were obtained for the 5 standard chemicals by each lab; STE is transferable.

# Inter-laboratory reproducibility

From the data of 20 cosmetic products,

- Concordance of category classification (irritant or non-irritant) was high.
- Concordances of category classification as well as rank classification were comparable with FL assay and BCOP assay.
- Technical improvement, especially in the step of sample preparation, may increase concordance.
